# Maxon Shut-Off and Vent Valves General Purpose

2" Series 5000-CP position "L" with stainless steel body

2.5" Series STO-ACP position "R"

- Electrically actuated valves shut off gas or oil lines reliably.
- **Normally open versions available** for vent or process purge lines with Maxon's long-lasting metal-to-metal seating.
- **Application flexibility provided** with 3/8" through 6" diameter line sizes, C<sub>v</sub> flow factors up to 1230, and line pressures up to 600 PSIG.
- All Maxon top assembly enclosures meet approval sanctions:
  - NEMA 1, 3, 3S, 4, and 12; CSA 2, 4, and 5; Available with NEMA 4X trim (optional)

# Normally open or normally closed valves

1.5" Series STO-M position "L"

4" Series 7000 position "L"

## Sanctioned service valve approvals:

- FM (Factory Mutual) sanctioned
- UL (Underwriters Laboratories) sanctioned
- CGA (Canadian Gas Association) sanctioned
- IRI (Industrial Risk Insurers) approvable for block/bleed/vent systems
- Contact your Maxon sales representative for international sanctions information

## • Handles flowing fluid temperatures:

- Rising stem bodies from -20°F (-28°C) to +140°F (+60°C)
- Swinging gate bodies from -20°F (-28°C) to +550°F (+288°C)
- Any ambient temperature from -20°F (-28°C) to +140°F (+60°C)
- Valve body connections designed to ANSI (American National Standards Institute) standards. ISO (International Standards Organization) standards also available.
- Various application requirements met with manual reset or automatic reset motorized operators.
- **Minimize line pressure drops** with straight-through flow swinging gate or rising stem (guillotine action) valve bodies

# Maxon Valves - large or small, gas or oil, open or closed

1" Series 23300 position "L"

1" Series 8730 position "TO"

1" Series 760 position "L"

- Minimal field maintenance required.
- Positive visual indication of valve body position is provided by large two-color open-shut indicator.
- Bodies built for heavy duty industrial service of one-piece cast iron, cast steel or cast stainless steel.
- Installation piping convenience obtained from field rotatable top assemblies.
- Special operating features available in Special Service Packaged versions.
- Micro-lapped seating wears in, not out.

# **Accessory Options**

1" Series 25300 position "L" with socket welded nipples & flanges

- Positive indication of valve body position provided through:
  - Auxiliary SPDT and DPDT signal switches mounted inside valve top enclosure.
  - Proof-of-open and/or Proof-of-closed position switches.
- Built-in over travel valve body design meets requirements of insurance standards.
- External junction box requirement eliminated with built-in valve wiring compartment and electrical terminal block.
- Manual reset valves may be mounted in overhead lines with use of wheel and chain option.
- Companion flange sets available to simplify installation.

1/99

# **Design Features and Operating Concepts**

# Valves with electro-mechanical actuators for quick opening or closing action

Normally closed shut-off valves are used in burner system fuel supply lines on industrial boilers, furnaces, ovens, kilns, and other heating processes. All valves are designed to shut-off fuel automatically and instantly with any interruption in the electric power supplied through your safety circuit.

These valves are also used for the **manual** or **motorized** opening or closing of pipe lines carrying gases and liquids commonly used in industrial processes. Normally closed valves cannot be opened until the interlocking safety control circuit is proven and resulting electrical power is supplied to the shut-off valve.

**Motorized automatic valve actuators** are used where remote access or unmanned applications are needed.

**NOTE:** Valve motors are protected against thermal overload. Normal duty cycles of 1 cycle per minute or less should allow motor thermal overload to sufficiently cool between cycles. If the normal valve duty cycle is exceeded, the motor must be allowed to cool before the thermal protection will automatically reset.

**Manual reset actuators** require operating personnel to be physically present to actuate the valve from its at rest position.

Normally open vent valves are most often used as the bleed valve in a block-and-bleed pipe train, sometimes required by insurance authorities. They are designed to open a vent line automatically and instantly upon any interruption in the electric power supply through your safety control circuit.

These normally open valves are also used in protective atmosphere systems and other gaseous and fluid service requiring quick opening or by-pass purging action.

Like the normally closed versions, both automatic and manual reset actuators are available for remote access locations, or when operating personnel's physical presence is preferred.

All Maxon valves feature one-piece cast iron or cast steel bodies with micro-lapped seats and discs. Straight through flow path minimizes pressure drop through full open swinging gate or rising stem (guillotine action) bodies.

Page 6106 Maxon Valves

# Valve Body Design Details

To provide seals in your process service lines, Maxon uses two different styles of valve bodies:

Rising stem (guillotine action) bodies are frequently used in normally closed and normally open gas valves. The microlapped, spring loaded guillotine disc gets a pressure assist from the flowing gases to seal against the downstream micro-lapped metal seat ring. The carefully machined seal surfaces and extremely close tolerances of the valve body operating mechanism promote positive closing action. Frequent cycling action constantly shears accumulated dirt or residue from the disc and seat to insure instantaneous and reliable sealing.

The location of the port in the disc is the basic difference between normally open and normally closed valve bodies. Both valves function by the top assembly mechanism driving the stem and disc down into the valve body, opening (or closing) the flow path. Both valves trip to their rest position when their top assembly's compression spring is released to pull the stem and connected disc up out of the body.

**Swinging gate bodies** are frequently used in normally closed oil valves and for some non-combustible gas applications. This design provides the same seal capabilities, but in a slightly different operating mode. The hard faced micro-lapped seat nut is threaded into the one-piece valve body. The free-floating, hard faced, spring loaded circular disc swings across the seat. Line pressure also assists in sealing the disc to the downstream seat.

Here again, frequent use and cycling actually helps to keep your valve clean. Since the free-floating disc is swinging across the circular seat nut on the arc created by the disc carrier, the disc rotates slightly on every cycle. This provides a fresh, clean surface area for sealing off the flow lines.

**Maxon valve bodies** have special service trim options available to meet your particular fluid service requirements. Contact your Maxon representative for details.

# **Valve Body Capacities/Specifications**

**Table 1: Normally closed valve bodies**

		6	869	RS
		J	1172	RS

[1] RS = Rising Stem valve body SG = Swinging Gate valve body

See catalog pages 6117-6119 for construction details.

**NOTE:** Typically, pressure drop for gas flows should not exceed 10% of inlet pressure; however, for 2" and smaller valves, the drop should not exceed 5 PSIG, and for 2.5" and larger valves, must not exceed 2.5 PSIG. Select valve size on basis of the **lower** of these parameters

to avoid critical flow conditions.

Table 2: Normally open valve bodies

Each complete valve assembly must include one of these valve bodies, regardless of ultimate series designation.

Flows through the valve body and resulting pressure drops may be estimated by inserting your specific conditions into the following formula and using  $C_{\nu}$  flow factors given for each valve body.

**Gases:** Q = (1360) x (C<sub>v</sub>) x 
$$\sqrt{\frac{(P_1 + P_2)}{G T_f}} x \sqrt{\frac{(P_1 - P_2)}{2}}$$

**Liquids:** 
$$V = (C_v) \times \left(\sqrt{\frac{(P_1 - P_2)}{G_f}}\right)$$

#### Where:

G = Gas specific gravity (air = 1.0)

G<sub>r</sub> = Specific gravity @ flowing temperature °F

P<sub>1</sub> = Inlet pressure PSIA (14.7 psi + psi gauge)

P<sub>2</sub> = Outlet pressure PSIA (14.7 psi + psi gauge)

Q = Cubic feet per hour @ 14.7 PSIA and 60°F

 $T_{i}$  = Flowing temperature absolute (460° + °F)

V = Flow in U.S. gallons/minute of water

Page 6108 Maxon Valves

# Valve Body Capacities with Natural Gas at 5 inches w.c. Inlet Pressure

**Approximate** pressure drops for various valve sizes and flows may be determined by using this graph.

Typically, pressure drop for fuel flows should not exceed 10% of inlet pressure.

Select valve size on basis of the **lower** of these parameters to avoid critical flow conditions.

# Valve Body Capacities with Natural Gas at 1 PSIG Inlet Pressure

**Approximate** pressure drops for various valve sizes and flows may be determined by using this graph.

Typically, pressure drop for fuel flows should not exceed 10% of inlet pressure.

Select valve size on basis of the **lower** of these parameters to avoid critical flow conditions.

Page 6110 Maxon Valves

# Valve Body Capacities with Natural Gas at 5 PSIG Inlet Pressure

**Approximate** pressure drops for various valve sizes and flows may be determined by using this graph.

Typically, pressure drop for fuel flows should not exceed 10% of inlet pressure; however, for 2" and smaller valves, the drop should not exceed 5 PSIG, and for 2-1/2" and larger size valves, must not exceed 2.5 PSIG.

Select valve size on basis of the **lower** of these parameters to avoid critical flow conditions.

# Valve Body Capacities with #2 Oil

To select a valve for YOUR application, use either C<sub>v</sub> factor calculations, or this graph showing approximate pressure drop at various flows of #2 oil.

Typically, pressure drop for fuel flows should not exceed 10% of inlet pressure.

For preheated #5 or #6 oil, multiply the required flow rate in GPH by the factor given in the table at right, then select a valve based upon that equivalent flow of #2 oil and the allowable drop.

Oil Grade	#	5	#6				
°F @ Inlet	125	160	120	140	180	210	220
Factor	1.43	1.11	2.86	2.00	1.25	1.11	1.05

For example: To size for 5 PSIG drop with a 3500 GPH flow of #6 oil preheated to  $140^{\circ}F$ , the multiplier is 2. Equivalent flow of #2 oil is then  $3500 \times 2$ , or 7000 GPH. Chart shows that a 5 PSIG drop will require use of a valve body having a  $C_v$  factor of at least 45.

Page 6112 Maxon Valves

# **Selection Data**Normally closed, swinging gate valves

#### **Series Designation**

Body Material>	Gray Iron		Cast Steel	
Top Assembly Function	Sanctioned Service [1]	Special Service (Non-sanctioned) [2]	Sanctioned Service [1]	Special Service (Non-sanctioned) [2]
Manual Reset	730	790	730-S; 760	790-S 33790; 23300
Automatic Reset	4730; 8730	4790; 8790	4730-S 4760; 8760	4790-S; 8790-S 33479; 25300

<sup>[1]</sup> **Sanctioned valves** are sold for fuel oils and may carry one or more sanctions (UL, FM, CGA). They are IRI approvable for liquified petroleum gases, #1 and #2 fuel oils, kerosene, JP-4 and preheated #4, #5 and #6 oils with maximum viscosity of 5000 SSU.
[2] **Non-sanctioned valves** do not carry blanket approval/listings, and the pressure limits shown apply only for selected special service applications. An analysis of your fluid will determine the actual rating, trim, and specifics for your application.

#### **Temperature Limits**

All of these valves can handle **fluid temperatures** from -20°F (-28°C) to +250°F (+121°C). The Series 33000 valves are designed to handle higher fluid temperatures up to +450°F (+232°C) and even up to +550°F (+288°C) with addition (at extra charge) of special stem seals.

**Ambient temperature limits vary.** Any valve on this page using DC voltage and all Series 8700 valves can handle ambient temperatures from -20°F (-28°C) to +125°F (+52°C). The other valves on this page handle ambient temperatures from -20°F (-28°C) to +140°F (+60°C).

#### **Operation**

All of these electro-mechanical valves require a constant supply of electrical energy to their holding solenoids inside the top assembly actuators. Once the solenoid is energized, the manual reset valve may be opened manually, or the automatic reset valve will automatically open. Any interruption of the electrical power to either of these valves causes an immediate trip of the valve to its normally closed position.

#### Features:

- Normally closed
- Electrically actuated
- Swinging gate body
- For shut-off service
- For liquid and noncombustible gas service

1" Series 760

- [1] **Sanctioned valves** may carry one or more sanctions (UL, FM, CGA) for air, natural and liquified petroleum gases. They are normally approvable for clean fuel gases. Additionally, series with internal trim -2 are sanctioned for #1 and #2 fuel oils (except Series 7000 (-S) are not listed FM approved for #2 fuel oil). 'SG' valves are preferable for liquid service (see page 6112).
- [2] **Non-sanctioned valves** do not carry blanket sanctions, and the pressure limits shown apply only for selected special service applications. An analysis of your fluid will determine the actual rating, trim and specifics for your application.

#### **Temperature Limits**

All these valves can handle **fluid temperatures** from -20°F (-28°C) to +140°F (+60°C). Oil viscosity not to exceed 5000 SSU. **Ambient temperature limits vary**. Any valve on this page using DC voltage and all Series 7000 valves can handle ambient temperatures from -20°F (-28°C) to +125°F (+52°C). The other valves on this page handle ambient temperatures from -20°F (-28°C) to +140°F (+60°C).

#### Operation

All of these electro-mechanical valves require a constant supply of electrical energy to their holding device inside the top assembly actuators. (In Series 808 and 5000 valves, the device is a solenoid and Series 7000 valves use an electro-magnetic clutch.) Once that device is energized, the manual reset valve may be manually opened, or the automatic reset valve will automatically open. Any interruption of the electrical power to either of these valves causes an immediate trip of the valve to its normally closed position.

#### Features:

# Rising Stem Body/Trim Specifications

All Maxon Rising Stem Gate Valves carry a twopart trim identification (for example, Trim 1-1).

The first digit (a 1, 2, 3, 4 or 5 before the hyphen) identifies valve body and bonnet material as shown in Table 1 below.

The second digit (a 1, 2 or 3 after the hyphen) identifies the specific internals used, as described in Tables 2, 3 and 4, and identified in the sketches at right.

*Internal trim -1* is normally suitable for clean fuel gases (for example, natural gas, propane, butane, clean atmosphere gases).

Internal trim -2 may be required for clean gases that require Viton seals or such gases as coke oven, refinery, town or off-gas.

Internal trim -3 is designed for more corrosive environments such as digester gas, sour natural gas and landfill gas. Contact Maxon with specific fuel analysis for prices and/or availability.

Normally closed and normally open threaded and flanged body versions are identical in material specifications.

The drawing at right carries item numbers matching those in Table 2. This information is furnished for identification only, not for ordering parts.

WARNING: Do not attempt field repair of Maxon valve body or electro-mechanical actuator. Any field alterations void all warranties.

# **Swinging Gate Body/Trim Specifications**

**Trim identification** of Maxon Swinging Gate Shut-Off Valves is two-part. The first digit before the hyphen is a number (1, 2, 3 or 4) identifying body material as shown in Table 1 below. The second digit after the hyphen identifies a trim utilizing the materials indicated in Table 2 below.

Standard sanctioned valves incorporating a *cast iron body* will normally be identified by trim 1-B or 1-D. Sanctioned valves with *steel body* will normally be trim 2-D.

Non-sanctioned services or unusual applications may require upgrading of internal trim. Contact Maxon with specific fuel analysis for price and availability.

The drawings shown on the following page carry item numbers matching those in Table 2. This information is furnished for identification only, not for ordering parts.

WARNING: Do not attempt field repair of Maxon valve body or electro-mechanical top actuator. Any field alterations void all warranties.

# Component Identification

#### **General Maintenance and Spare Parts**

All safety devices should be tested at least monthly\* and more often if deemed advisable. Periodic testing for tightness of manual or motorized shut-off valve closure is equally essential.

\*per NFPA 86-Appendix B-4 (1995)

These Maxon valves are designed for long troublefree service. Only items shown as suggested spare parts are considered field replaceable.

WARNING: Do not attempt field repair of valve body, top assembly or motor drive unit. Any alterations void all warranties.

To determine suggested spare parts, identify series designation and serial number from the valve's nameplate. Refer to the illustration and legend below to identify suggested spare parts.

#### To order, specify:

- 1. Quantity
- 2. Assembly part number (if available)
- 3. Description
- 4. Electrical specification
- **5. Full nameplate information** (from existing valve)

#### Manual Reset

#### **Automatic Reset**

Note: Drawings are illustrative only. Actual valves may vary slightly.

# Electrical Data

## for normally closed valves

#### General

All Maxon shut-off valves are electrically actuated from a power source, normally through the flame safeguard and/or safety control circuits.

Standard valve assemblies include an internal holding solenoid or printed circuit board for 115 volt 60 hertz AC power. (Other electrical current options are available upon request.)

Series 808, 730, 760, 5000, 4730, and 4760 valves have the internal solenoid. Series 8700 and 7000 valves incorporate the printed circuit board.

The solenoid (or the printed circuit board) is energized whenever the valve is powered. The motor operator on automatic reset versions is powered only during the opening stroke.

**Switch wiring diagrams** (reproduced on the next page) are part of each valve assembly, summarizing electrical data and wiring for a valve equipped with terminal block and a full complement of optional signal switches.

Diagrams show valve in its normally closed (at rest) position. The indicated internal wiring is present only when the appropriate auxiliary switches are specified. Automatic reset valves always include a VOS-1 SPDT valve open motor limit switch.

Good practice *normally* dictates that auxiliary switches in valves used for safety shut-off functions should be used for signal duty **only**, not to operate additional safety devices.

#### Signal switch designations:

**VCS** (Valve Closed Switch) is actuated at the end of the closing stroke. VCS-1 is SPDT; VCS-2 is DPDT.

**VOS** (Valve Open Switch) is actuated at the end of the opening stroke. VOS-1 is SPDT; VOS-2 is DPDT.

Switch amp ratings are shown on the schematic wiring diagrams on page 6122. DO NOT EXCEED rated amperage or total load shown.

## **Electrical Data**

#### for normally open valves

#### General

All Maxon normally open vent valves are electrically actuated from a power source, normally through the flame safeguard and/or safety control circuits.

Standard valve assemblies include an internal holding solenoid for 115 volt 60 hertz AC power. (Other electrical current options are available upon request.)

The solenoid is energized whenever the valve is powered. The motor operator on automatic reset version is powered only during the closing stroke.

Switch wiring diagrams (reproduced below and on next page) are part of each valve assembly, summarizing electrical data and wiring for a valve equipped with terminal block and a full complement of optional signal switches.

Diagrams show valve in its normally open (at rest) position. The indicated internal wiring is present only when the appropriate auxiliary switches are specified. Automatic reset valves always include a VCS-1 SPDT valve closed motor limit switch.

Good practice *normally* dictates that auxiliary switches in valves used for safety shut-off functions should be used for signal duty **only**, not to operate additional safety devices.

#### Signal switch designations:

**VCS** (Valve Closed Switch) is actuated at the end of the closing stroke. VCS-1 is SPDT; VCS-2 is DPDT.

**VOS** (Valve Open Switch) is actuated at the end of opening stroke. VOS-1 is SPDT; VOS-2 is DPDT.

Switch amp ratings are shown on the schematic wiring diagrams below and on the next page. DO NOT EXCEED rated amperage or total load shown.

# **Auxiliary Signal Switches**

All Maxon valves may be equipped with internally-mounted signal switch(es) to provide a "proof-of-open" or "proof-of-closure" valve position indication.

Auxiliary signal switches indicate when valve is open or closed and are normally connected electrically into your control panel lights or warning device circuit(s).

#### For normally-closed valves:

VCS (Valve Closed Switch) is actuated when valve is fully shut. It is the upper, inverted snap-switch mounted on rear of switch bracket. VCS-1 is an SPDT (single-pole, double-throw) switch. VCS-2 is a DPDT (double-pole, double-throw) switch. All contacts are available for external circuitry.

VOS (Valve Open Switch) is actuated when valve reaches full-open. It is the lower snap-switch mounted

on front of switch bracket. VOS-1 is an SPDT switch. On automatic reset valves, its normally closed contact serves as a motor limit switch and is not available for external circuitry. On manual reset valves, normally closed contact is available for external circuitry, but is not wired to optional terminal block. VOS-2 is DPDT, used in lieu of VOS-1 for additional contacts.

**Valve Shut** 

Valve Open

Photos above of normally-open valve (typical for Series STO-MCP (-S), STO-ACP (-S)

All Maxon proof-of-open and proof-of-closure signal switches work in a similar manner; but due to different styles and types of top assembly housings, the switches appear in slightly different positions in the various types of valves. Illustrated below are representative top housings for 4" - 6" Series 7000 (Fig. 3) and .375" - .75" Series 8700 (Fig. 4) valves. Switch locations are noted on sketches.

# **Tandem Arrangements**

(for simultaneous opening of main and blocking valves)

#### General

Wherever insurance underwriters or other regulatory groups require the use of a double-valve or "block-and-bleed" system, but manual operation is preferred to the use of automatic reset valves, operation can be simplified by adding a tandem arrangement to a pair of Maxon manual reset shut-off valves.

A linkage overtravel spring in the tandem arrangement latches the blocking valve just before the main valve is latched, assuring latching of both valves.

If it is necessary to locate a tandem valve above arms reach, an overhead wheel and chain assembly may be added which includes a loop of chain accessible to operating personnel.

#### To order

Valves are to be specified in the usual manner and must be in top assembly position TO or AW.

VOS and VCS switches must be included on the main valve and a VOS switch on the blocking valve to permit electrical connection as shown in the wiring schematic illustrated at right.

If overhead wheel and chain assembly is also required, specify loop length to reach appropriate operating position. Extra chain (in one foot increments) may be specified.

Center line distance between valves must be within the ranges indicated in Table 1 and shown in sketch below and must be specified at the time of order.

#### Tandem Arrangement with Overhead Wheel & Chain

# Blocking Valve Tension Spring Specify loop length if overhead wheel & chain option

## **Tandem Arrangement**

Page 6132 Maxon Valves

# Overhead Wheel & Chain Assembly

Overhead wheel and chain assembly allows operation of a manual reset valve in an otherwise inaccessible overhead location. A wheel is mounted onto the handle of the valve. The attached chain is weighted on one end and has a paddle handgrip on the other.

Once the valve is electrically energized, pulling down on the paddle will open normally closed versions or close normally open versions.

Maxon valve's free-handle design permits valve to trip to its rest position on any power interruption.

Wheel and chain assembly includes a length of chain to position the paddle handgrip slightly below pipe centerline. A standard length of 7 feet of chain is included with CP and larger valve sizes and 5 feet is included with all other valves. Extra chain (in one foot increments) may be specified to fit your specific location.

#### Approximate envelope dimensions (nominal, in inches)

#### Swinging gate valves

#### Rising stem valves

**NOTE:** Overhead wheel & chain can only be mounted on swinging gate valves with the top assembly position TO.
